

Radar Decision Support Platform for Legal and Privacy Professionals

Operationalize the management of regulated data

“Radar offers an excellent risk assessment product for privacy and security incidents. The interface is easy to use and the decision-support content and laws database is up to date and reliable. Radar is a great tool for any privacy professional’s arsenal.” — Julia Jacobson, Partner, K&L Gates

Decision Support Platform for Incident Response

Radar is a SaaS based decision support solution specifically designed to provide legal and privacy professionals efficient and consistent incident risk assessments in order to make timely notification decisions for compliance with complex and changing international and U.S. (federal and states) data breach laws. Radar serves as an operational infrastructure for managing the lifecycle of data privacy and security incidents involving personal data. The legal library and regulatory workflows within Radar are kept current to address the latest incident risk assessment, documentation, and reporting requirements based on regulatory requirements and contractual compliance frameworks designed and approved by privacy counsel.

Radar’s patented Breach Guidance Engine™ uses multiple risk factors to score each incident, producing a heatmap that quantifies each incident’s severity and data sensitivity levels in alignment with counsel’s approved policies and notification guidance. This provides a consistent and scalable process for incident assessment, and streamlines the otherwise time-consuming, repetitive research and subjective risk assessment processes to ensure compliance with breach laws across all applicable jurisdictions.

For example, Radar is inherently aware of each jurisdiction’s unique definition of personal data, risk of harm standard, and any notification exceptions. This provides valuable decision support to privacy counsel on notification and reporting requirements across all applicable jurisdictions.

Radar for Privacy Counsel

Most organizations that maintain personal data experience incidents on a regular basis. This requires counsel’s strategic

Key Features in Radar

- ✓ Patented multi-factor incident risk assessment and decision support
- ✓ Consistent and scalable incident management process and dashboard
- ✓ Notification tracking and user alerts
- ✓ Central repository for secure storage of incident-related documents
- ✓ Real-time reports and trend analysis
- ✓ Audit log for future reference or regulatory inquiry
- ✓ Audited security standards that support attorney-client privilege

advice to establish a compliant incident response framework that the organization can effectively operationalize. The majority of these incidents are inadvertent in nature so the framework must be conducive to managing both inadvertent and malicious incidents. Radar provides privacy counsel a purpose-built solution for establishing and implementing incident response policies to help organizations remain compliant with data breach laws while supporting privacy counsel’s role as the regulatory subject matter expert, ensuring counsel is in control over ultimate breach determination.

Stay Up-to-date with Regulations

Radar provides counsel and privacy teams the ability to stay current with changing breach notification laws by monitoring

multiple sources for proposed legislation and changes to international and U.S. breach notification laws, maintaining a published and up-to-date regulatory watchlist, and ensuring that any changes impacting the decision support process for counsel are incorporated into the solution prior to the enforcement date. Radar also provides access to a robust law library for breach notification laws across certain international and U.S. jurisdictions.

Improve Efficiency & Accuracy

Since no two incidents are alike and breach laws often vary in scope (e.g., electronic vs. paper, personal data definition, data protection and remediation sufficiency), Radar provides counsel tremendous efficiency and accuracy by cutting down the time required for regulatory research and the risk of missing pertinent information in the process. Without Radar, legal research and incident risk assessment is a manual and subjective process which can cause inconsistency, delayed notification and risk of non-compliance.

Radar is used by a rapidly growing number of Fortune 1000 organizations and their privacy counsel across multiple industries (e.g., financial, insurance, and healthcare). Radar provides the necessary decision support capability and risk quantification to drive accurate and consistent results across the organization.

Operationalize Counsel's Incident Response Policies

Radar enables privacy counsel to implement incident response policies and guidance so the organization can operationalize their compliance program with counsel's oversight. The efficient Radar workflow also streamlines how organizations escalate privacy and security incidents – both electronic and paper – to legal and privacy teams. Radar's web submission form allows anyone in the organization to securely submit a suspected incident for investigation and legal review.

Leverage Technology to Support Regulatory Expertise

Radar's patented Breach Guidance Engine™ standardizes and automates the incident risk assessment process and provides counsel with an effective decision support tool to help determine whether an incident is a notifiable breach. Radar provides counsel the ability to adjust the contextual

sensitivity of the personal data involved when performing risk assessments to ensure adherence to an organization's internal policies and culture of compliance. Additionally, once a decision to notify is made by the organization, Radar provides all the notification requirements and timelines under applicable international and U.S. laws, creating greater efficiency and reducing risk of non-compliance.

Prove Compliance

Radar helps document compliance in an organization by ensuring incident risk assessments are performed consistently and always in compliance with ever-changing international and U.S. data breach notification regulations. Radar stores documentation, counsel's notes, and attachments in a central repository that is easy for regulators and senior management to access. Radar follows strict third party-audited security standards that ensure client-attorney privilege is maintained.

Use Analytics to Reduce Breach Risk

Radar reduces breach risks across an organization by identifying and analyzing where, how, and why incidents occur, identifying trends that help the organization reduce the risk of future incidents. The Radar dashboard helps spot trends and pulls detailed reports in seconds.

Compliance with Contractual Obligations

Incident response, especially for business associates, often involves contractual notification obligations in addition to regulatory obligations. Current processes for managing contractual obligations are almost always manual and error prone. Radar's patented Contractual Obligation Workflow will help privacy counsel ensure that the organization remains in compliance with its business associate agreements and contractual agreements.

Peace of Mind: Operationalize Compliance with Radar

By providing up-to-date decision support, operational infrastructure, legal libraries, documentation, and workflows, Radar brings consistency to the incident assessment and response process. Armed with this solution, privacy counsel is able to focus on delivering the legal advice and strategic guidance that organizations need to reduce data breach risk and effectively operationalize their privacy and compliance programs.

RadarFirst's award-winning incident response management software is trusted by organizations in heavily regulated industries to reduce risk and simplify compliance with global data breach laws, including the EU GDPR.
