Incident Facets

Simplify management of incidents involving multiple privacy data sets and risk factors

RadarFirst

Every day, organizations experience privacy incidents exposing sensitive and regulated data.

To demonstrate compliance with data breach laws, privacy teams are required to perform a multi-factor and multi-jurisdictional risk assessment on each incident to determine if notification is required under the applicable regulations.

These privacy and security incidents don't always involve a single privacy data set. For example, a stolen briefcase may contain a tablet, financial statements, and a thumb drive, each holding a unique set of data impacted by different risk factors or subject to different regulatory requirements. Or a multinational company may experience an unauthorized disclosure of personal data belonging to both US and EU employees.

Introducing Incident Facets

Radar's patent-pending Incident Facets feature allows for the ability to manage multiple data sets or facets related to a single incident. With Incident Facets, these data sets are easily documented and assessed as unique subsets of a single incident, ensuring organizations don't over-count incidents and maintain an accurate account of privacy data occurrences.

Benefits of this feature:

- Manage multiple privacy data sets resulting from a single incident to avoid over-counting incidents.

- Allows for precision in incident risk assessment, drilling down into which data sets were exposed and documentation of the facts pertinent to that particular data set.
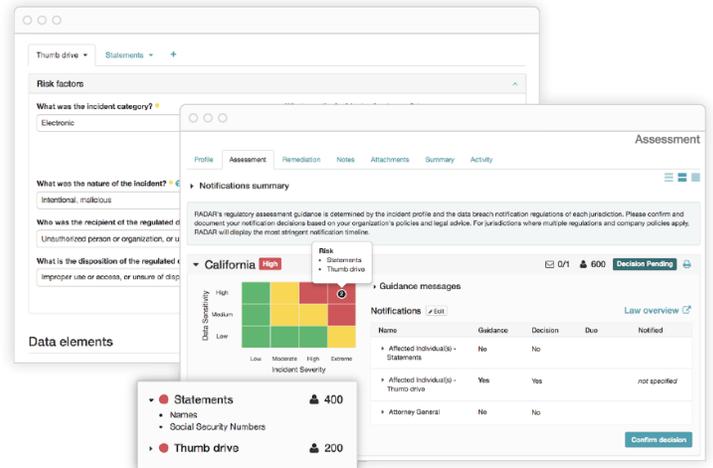

Example assessment result, displaying the facet-specific guidance for two types of data sets (paper and electronic) associated with a single incident.

- Document and capture extensive detail of each incident, in support of your organization's notification decision and burden of proof obligations under data breach laws.

- All incident facets benefit from Radar's multi-factor risk assessment and decision-support guidance for state, federal, and sector-specific data breach laws – as well as the European Union's Global Data Protection Regulation (GDPR).

- Facet-based information is additionally displayed in the Dashboard, Reports, Assessment page, and Summary page within Radar, providing real-time visibility.
